Dear Professor Hermanowicz,

I read your article “The Culture of Mediocrity” with interest and with total agreement.

Two other authors have written similarly, see below*.

I think I can show that the considerable gap present in scientific progress may in part be filled by my contribution to science and art.

I grew up in Hungary, came to US at age 15 and have attended CUNY and Harvard Grad. School without keeping any academic connections afterwards.

I have been drawn to discovery and to explaining many things not yet understood. For instance, focusing on language I saw that linguistics is not yet a science and I have introduced a new paradigm that makes it so. Current research on language is no different from what Swift had satirized in his Gulliver’s travels.

If I can interest you please see a brief list of topics and my resume at <https://www.garystong.com/>

PS I have hired a publicist agency to get me an invitation to Emory U. to give a lecture on my material, but have not yet finalized because I can’t be sure of the quality of the audience and what I offer will still remain unknown.

Sincerely,
Gary Schweitzer Tong
